OPIOID OVERDOSE PREVENTION

- overdose risk factors and prevention
- overdose myths

SIGNS OF OVERDOSE

- recognizing opioid overdose
- the difference between nodding and overdose

STEP 1: SHAKE & SHOUT

 providing stimulation to an unresponsive person by shouting their name or shaking their shoulders

STEP 2: CALL 911

- importance of calling 911 if the person is unresponsive
- Good Samaritan Drug Overdose Act
- communicating with the 911 operator & first responders

STEP 3: GIVE NALOXONE

administering naloxone
 (1 spray into nostril, or inject
 1 vial or ampoule into arm or leg)

STEP 4: RESCUE BREATHING AND/OR CHEST COMPRESSIONS

 perform rescue breathing and/or chest compressions as trained

STEP 5: REASSESS

- if there is no improvement after 2-3 minutes, administer another naloxone dose(s) and continue rescue breathing and/or chest compressions
- staying with a person until EMS arrives or for 2 hours if 911 not called

AFTERCARE

 how long the effects of naloxone last

- why a person shouldn't use more drugs right after an overdose
- watching for the return of overdose symptoms
- putting the person into the recovery position

NALOXONE CARE & REFILLS

- storing naloxone (temperature)
- keeping naloxone handy and monitoring the expiry date
- how to get refills
